Empowering Independence, Ensuring Wellness

Monitor daily care routines and wellness indicators of seniors living independently.

VoiceHealth Remote Therapeutic Monitoring

The automated VoiceHealth system allows our healthcare professionals to monitor the daily care routines and wellness indicators of a senior living independently. Through daily data collection, trending and monitoring, the program can assist in reducing unnecessary emergency room visits, while getting individuals the care they need when changes first occur.

VoiceHealth, our proprietary software program, utilizes a patented voice-activated, hands-free 24/7 emergency response system with the intelligence of Alexa called VetAssist® Companion.

HOW IT WORKS

Clients answer personalized questions and their responses populate instantly on the VoiceHealth Dashboard. This provides our healthcare professionals real time information, giving them the details to respond as needed to any concerns or changes that may be occurring.

Texts and emails are sent immediately to our healthcare professional and/or your assigned contacts if an answer falls in the "Red Zone."

FOLLOW UP

The system logs your responses each day, facilitating the quick identification of any changes or variations in your responses.

A healthcare professional from our team will be reviewing responses for any fluctuations noted and will reach out to you and/or your designated contact to check in on your health and wellbeing.

VETASSIST COMPANION

Using Alexa technology, VetAssist® Companion creates a personalized, whole-home system of smart medical alert devices to help seniors maintain an independent lifestyle and provide caregivers with peace of mind.

Each day you will use your VetAssist® Companion to open the VoiceHealth skill. The program will ask you the questions created specifically for YOU based on your health needs.

The VoiceHealth proprietary software utilizes the VetAssist® Companion system and is a required component of the program.

Key Features

- **Wellness Indicators**

The system tracks vital health indicators such as blood pressure, weight, potential swelling or bruising, medication usage and mobility, providing valuable data for healthcare decisions.

- **Alerts and Notifications**

A designated contact and healthcare professional will receive alerts in real-time if any concerning changes or irregularities are detected, enabling prompt intervention when necessary.

- **Data-Driven Insights**

VoiceHealth collects and analyzes data over time, offering insights into long-term health trends and helping seniors and their caregivers make informed decisions about their care.

All answers to each individual's personalized questions are recorded and saved within the VoiceHealth proprietary software portal every day. Our healthcare professionals will have access to the informational dashboard with responses gathered as soon as questions are answered.

The dashboard clearly displays the daily answers to each question to easily identify trends and variations in responses that may require additional follow up or care.
